

Recent developments in static magnetoelasticity with variational structure

Stefan Krömer

ÚTIA, Czech Academy of Sciences, Prague, Czech Republic

We will discuss the so-called single field model for magnetostatics and its links to more traditional magnetostatic models, as well as extensions to magnetoelasticity. In case of small strains, we obtain a new homogenization result for the single field model, for a linearly elastic material with rigid microscopic magnetic inclusions.

Joint work: Raffaele Grande (U. Salento, Lecce), Martin Kružík (ÚTIA CAS, Prague), Giuseppe Tomassetti (U. Roma 3).
